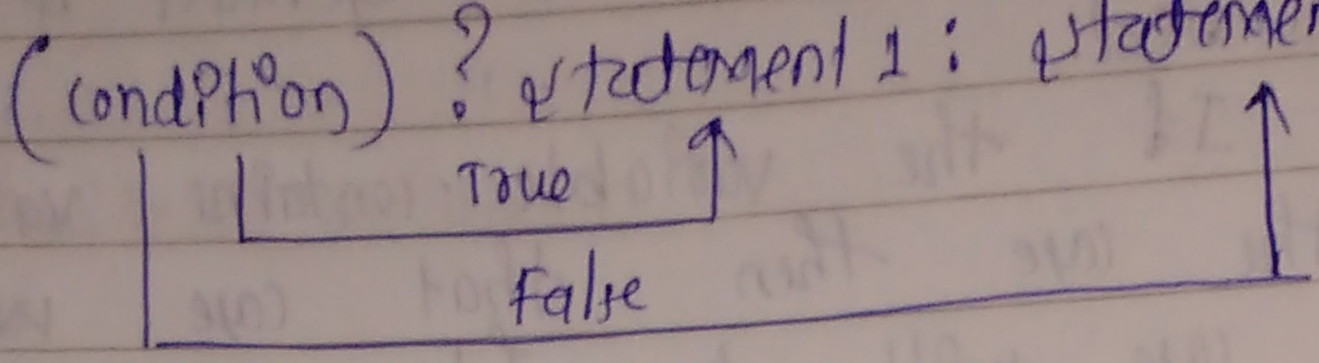
c) CONDITIONAL OPERATOR:



In conditional operator if the specified condition is true it will execute statement b/w ? and :. i.e statement 1. If the specified condition is false it will execute statement followed by : i.e statement 2. It is an alternate to if else but the difference is that in case of conditional operator only one statement can be specified when the condition is true or when the condition is false. Wherever in case of if else one or more statements can be specified when the condition is true or when the condition is false conditional operator is known as turnary operator which operator an 3 operands.

NOTE:

Above selection constructs can be Nested one within the other in any combination which is known as Nested selection construct.
