or in logical expressions they can be accessed with the help of any of the nested loops. But nested for loops are the best suitable loops.

Defining two diamentional Array
<data type> <array name> [ROW SIZE] [COL SIZE];

Ex

int a[3][2];

→ Column size
→ Row size
→ Array name
→ Data type

a[0][0]

a[2][1] } subscript values.

Row no/: ←
column no/: ←

If the initial values are not provided then the elments of two diamentional array will have undefined value initial values can
